EDUCATION

Master of Science in Analytics, Northeastern University — Boston, MA Expected Jan. 2028
Bachelor of Science in Economics and Commerce, Università degli Studi di Firenze — Firenze, Italy Jul. 2025

TECHNICAL SKILLS

Programming & Tools: Python, R, SQL, DBeaver, Neon, GitHub, Tableau, PowerBI, MS Office

Methods: Panel and fixed-effects models, Box-Jenkins time-series models (ARIMA, SARIMA), API data ingestion, data-quality auditing, relational data modeling (ER, 3NF)

Languages: Italian (Native), Mandarin Chinese (Native), English (Fluent)

PROFESSIONAL EXPERIENCE

Investment Banking Division Intern, Huatai International — Hong Kong Mar. 2023 – Jun. 2023

- Compiled issuer, shareholder, and equity-participation profiles from five source types into due-diligence packs for the deal team
- Prepared IPO rating reports on three companies, combining industry, enterprise, and market analysis
- Drafted IPO resumption materials for a Beijing technology issuer and assessed listing feasibility for a mobile gaming developer
- Performed due diligence on target companies and contributed to the equity evaluation of a listed US semiconductor firm — market expectations, investment value, and risk exposure

Clerical Assistant, Italiandivani — Forlì-Cesena, Italy Jul. 2019 – Aug. 2019

PROJECTS

Cross-National Public Health Analysis — HIV in Sub-Saharan Africa | [GitHub](#) Feb. 2026 – Sep. 2026

- Built a 771 country-year panel of 44 Sub-Saharan African countries (2005–2022) from the World Bank API in Python (pandas, statsmodels)
- Estimated regressions with country and year fixed effects, finding each percentage point of antiretroviral coverage tracks 2.5% fewer AIDS deaths and 1.4% fewer new infections
- Reframed the mechanism as an untreated-reservoir term, prevalence $\times (1 - \text{coverage})$, a single variable explaining 91% of the variation in log incidence
- Audited the original hand-built Excel study and identified 14 errors, including a headline indicator off by a factor of four; published both versions so the correction stays reproducible

WTI Crude Oil Prices Against Global Events | [GitHub](#) Jul. 2026 – Sep. 2026

- Analyzed 56 years of WTI crude prices (FRED, 1970–2026), converting every price to 2026 dollars to rank real shocks, June 2008 (~\$206) and the entire real top five fell within that single year
- Built automatic event matching against 15 curated geopolitical events, capturing 9 of the 10 largest monthly price moves
- Produced rolling dollar-index correlations and an ARIMA(1,1,1) forecast with prediction intervals

Wine Cellar Management System | [GitHub](#) Mar. 2026 – Aug. 2026

- Designed a seven-table, third-normal-form SQLite schema for a private wine collection, normalizing appellation out of free text to remove a transitive dependency
- Wrote 12 analytical queries covering the collection's operating questions: bottles closing their drinking window, cellars near capacity, and total holdings value
- Enforced integrity with 16 CHECK constraints, catching a NULL-comparison bug that let half-open drinking windows pass validation
- Backed the schema with 83 pytest cases running in GitHub Actions CI
